

## MARITIME DOMAIN AWARENESS

# MANTIS

See the anomaly before it becomes the incident.

MANTIS is a live operations picture for South-East Asian waters. It turns crowded AIS traffic into a command view of the behaviours that matter: vessels that go dark, ship-to-ship transfers at sea, and unauthorised anchoring in sensitive waters.

Built for the watch floor — maritime security, coastal surveillance, port control and investigative command.

## Inside the operations centre

Operations Overview — Malaysian Waters, Straits of Malacca and the South China Sea. Live maritime picture with threat indicators and AI Copilot.

# The Live Maritime Picture

One screen. The whole theatre. Operators move from a regional picture to a zone of interest — Johor Strait, the Malacca approaches, the South China Sea — without losing the threat picture.

● STS activity

● Dark vessels

● Illegal anchoring

● AI Copilot on the watch floor

# What MANTIS Detects

Anomaly intelligence for the marine industry — not another map of every ship. MANTIS isolates the behaviours that change risk, cargo and command attention.

## SHIP-TO-SHIP

### STS transfers at sea

Mid-sea pairing is where cargo, bunkers and risk change hands. MANTIS surfaces active ship-to-ship activity on the live picture so the watch floor can see who is alongside whom, how long they have been together, and where the transfer is unfolding — including in designated anchorage waters.

## AIS SILENCE

### Dark vessels

When a vessel goes dark, the feed simply stops. MANTIS keeps that disappearance in the operational picture: suspected dark activity after unusual behaviour, likely coverage exit at the edge of the theatre, and high-confidence leads ready for tasking — with the last known location still on the map.

## RESTRICTED WATERS

### Unauthorised anchoring

Not every stop is innocent. MANTIS watches restricted waters and designated watch zones for vessels that linger where they should not — a clear cue for coastal enforcement, port control and security patrols across the Straits and coastal approaches.

## From picture to decision

### Threat indicators, live

STS, dark activity and anchoring summarised beside the map — so command sees volume, urgency and confidence without leaving the picture.

### Zone focus & intercept view

Move from the regional theatre to a strait, an anchorage or an intercept in a single action. The live picture stays coherent as the operator drills in.

### AI Copilot on watch

Brief the room from the same screen. Ask the operational picture — not a spreadsheet — what is unfolding in Malaysian waters, the Malacca Strait and the South China Sea.

# Why it matters

South-East Asian sea lanes carry the world's energy, containers and risk. In that density, the dangerous act is rarely the ship that looks busy — it is the pairing, the silence, the stop that does not belong.

MANTIS gives maritime command a **single operational picture** of those anomalies: situational awareness for the Straits of Malacca, coastal approaches and the South China Sea, with threat indicators that are already in the language of the watch floor.

## On the watch floor

- Maritime security and coast watch centres
- Vessel traffic and port control
- Coastal compliance and enforcement
- Sanctions, bunkering and investigative desks
- Naval and coast-guard operations

# Command value

## OUTCOME

### Situational awareness

A live maritime picture instead of a pile of tracks. Operators see anomalies in geography, not in a log.

## OUTCOME

### Faster triage

Threat indicators separate STS, dark activity and illegal anchoring so the next action is obvious.

## OUTCOME

### Credible briefing

Walk a principal from the regional theatre to a single vessel — map, indicators and Copilot on one screen.

## Request a live operations walkthrough

One dark vessel. One STS pair. One illegal stop. On the map.

*MANTIS is an operational intelligence aid for the marine industry — not a legal determination. Always combine with local authority, permits and human review.*
